METABOLISM IN PLANTS

Metabolism is the total amount of the biochemical reactions involved in maintaining the living condition of the cells in an organism. All living organisms require energy for different essential processes and for producing new organic substances. The metabolic processes help in growth and reproduction and help in maintaining the structures of living organisms. The organisms respond to the surrounding environment due to metabolic activities. All the chemical reactions occurring in the living organisms from digestion to transportation of substances from cell to cell require energy.

There are two types of metabolic process:

- Catabolism
- Anabolism

Catabolism – This process is mainly involved in breaking down larger organic molecules into smaller molecules. This metabolic process releases energy.

Anabolism – This process is mainly involved in building up or synthesizing compounds from simpler substances required by the cells. This metabolic process requires and stores energy.

Metabolism is related to nutrition and the existence of nutrients. Bioenergetics describes the metabolism as the biochemical pathway through which the cells obtain energy. One of the major aspects is the energy formation.

The processes of metabolism depend on the nutrients that get digested to produce energy. This energy is necessary to synthesize nucleic acids, proteins and other biomolecules in our body. Encompassed nutrients include various substances for the body requirements which are either in the sufficient amount or insufficient, resulting in poor health, concerning metabolism. Necessary nutrients help by supplying the required energy and other necessary chemicals that the body cannot synthesize on its own. Food provides different substances that are essential for the bodybuilding and repairing of tissues along with the proper functioning of the body. The diet requires both organic nutrients and inorganic chemical compounds. Organic nutrients include fats, vitamins, carbohydrates, and proteins. Inorganic chemical compounds include oxygen, water, and other dietary minerals.
